To keep your HVAC system performing at its best, replace its filter at a frequency appropriate to its use. If the HVAC system is used regularly, most experts recommend replacing the filter at least every 3 months. Factors that may increase your filter replacement frequency include:

- Units with multiple occupants vs. single occupant
- Units with pets
- Units where resident smokes
- Units where occupants experience allergies

Replacement filters come in two general types: Fiberglass and pleated. Fiberglass filters are cheaper, while pleated filters provide superior filtering action.

Filter effectiveness is rated using the term “MERV” (minimum efficiency reporting value). Filters with higher MERV values filter better than those with low values.

Standard size replacement filters are available from home supply stores. For custom size replacement filters, residents may want to purchase from one of the following:

- Local supplier: ENE Controls Distribution
3285 MARKET STREET, SAN DIEGO, CA 92102
619-779-1686
